

Sustainable forestry at EGGER

Sustainable forestry is given the highest priority at EGGER. This perspective is also deeply rooted in our mission statement. EGGER only uses residual wood in selected quality from sawmills, forest thinning and suitable recycled wood for the production of wood based panels. Priority is given to the supply and use of wood from the immediate proximity around our plants, therefore avoiding long delivery distances.

EGGER has created a closed loop cycle from the raw material through to the end product, which provides an active environmental contribution towards the protection of our forests.

It is a fundamental principle of EGGER to exclude the following sources:

1. Illegally harvested wood;
2. Wood originating from regions where traditional or fundamental civil rights are contravened;
3. Wood originating from uncertified forests which have a high protection value;
4. Wood from genetically modified trees;
5. Wood originating from forests that will be converted into plantations or into non-forestry uses.

We act responsibly with regard to forests and the environment, and within the scope of Chain of Custody procedures, depending on the availability of the wood, are certified according to PEFC(certificate HCA-CoC-183) and FSC (certificate HCA-CoC-100017 und HCA-CW-100017).
